Facultat de Matemàtiques i Estadística

Curs Lagrange

1736-1813

Master in Advanced Mathematics and Mathematical Engineering

UNIVERSITAT POLITÈCNICA DE CATALUNYA
BARCELONATECH
Facultat de Matemàtiques i Estadística

Program

As reflected in its name, this master has a dual academic and professional orientation.
On the academic side, it provides the skills and techniques needed in scientific research in general and, more specifically, in mathematical research.
On the professional side, the goal is to provide the students with an advanced background to work in interdisciplinary teams, in cooperation with engineers, physicists, biologists, economists, etc.
The master benefits both from the leading role of Spanish mathematical research at the European level and the technological environment of a technical university such as UPC–Barcelona Tech.

Structure

The master duration is 60 ECTS (European Credit transfer System) credits, and is intended to be completed in one academic year. This comprises 45 ECTS in courses and a master thesis (15 ECTS).
Master courses are offered in five broad fields: Algebra and Geometry; Discrete Mathematics and Algorithms; Modelling in Engineering and Biomedical Sciences; Differential Equations; Scientific Computing.
In addition, up to half of the course credits (i.e. 22.5 ECTS) may be taken from other master courses. This offers an excellent opportunity of specialisation in a given field according to one's preferences.
The official teaching language of this master is English.

Specific requirements

This master is addressed to students with good abstract reasoning, interest in problem solving, strong work habits and a liking for mathematics.
A scientific background is required, with basic mathematical foundations. For these reasons, a bachelor in mathematics, statistics, physics, engineering, economics or science is recommended. This list is non-exclusive, and all applications will be reviewed on an individual basis.

Career prospects

Some of the career prospects of master graduates are academic research (by pursuing a PhD in mathematics, sciences or engineering, for instance), mathematical modelling, finance, statistics, applied research (biomedical research centers, computer vision, etc.)

Tutoring of the Students

The initial tutoring is the responsibility of the Master's Academic Coordinator (jfranch@ma4upc.edu) and is performed mainly in the period prior to enrollment, often online. In addition, there is a welcome session just before courses start.

Because the master duration is 60 ECTS, students should start early to worry about their final master thesis (TFM). In this sense, beyond the support of the Academic Coordinator, they have access to an intranet to determine which TFMs are available. There, they will find information about the range of topics, detailed objectives, content and teaching responsibility. Thus, at the end of the first term, students should already have chosen their TFM. From this point, the TFM advisor assumes tutoring.

Additional information

Interested? Please check http://mamme.masters.upc.edu for more details and see leaflet.

34951 - NCA - Non-Commutative Algebra

Coordinating unit:	200 - FME - School of Mathematics and Statistics
Teaching unit:	727 - MA III - Department of Applied Mathematics III
	743 - MA IV - Department of Applied Mathematics IV
Academic year:	2013
Degree:	MASTER IN ADVANCED MATHEMATICS AND MATHEMATICAL ENGINEERING (Syllabus 2010). (Teaching unit Optative)
ECTS credits:	7,5 Teaching languages: English

Teaching staff

Coordinator:	JOSE BURILLO PUIG
Others:	
	JOSE BURILLO PUIG - A

Prior skills

The concept of group and subgroup, and the concept of homomorphism. Basic algebraic properties, binary operations, their properties. Equivalence relations and related set-theoretic properties.

Requirements

The basic algebra courses from the degree in mathematics.

Degree competences to which the subject contributes

Specific:
   1. RESEARCH. Read and understand advanced mathematical papers. Use mathematical research techniques to produce and transmit new results.
   2. CALCULUS. Obtain (exact or approximate) solutions for these models with the available resources, including computational means.
   3. CRITICAL ASSESSMENT. Discuss the validity, scope and relevance of these solutions; present results and defend conclusions.
Generical:
   4. SELF-DIRECTED LEARNING. Detecting gaps in one's knowledge and overcoming them through critical self-appraisal. Choosing the best path for broadening one's knowledge.
   5. EFFICIENT ORAL AND WRITTEN COMMUNICATION. Communicating verbally and in writing about learning outcomes, thought-building and decision-making. Taking part in debates about issues related to the own field of specialization.
   6. THIRD LANGUAGE. Learning a third language, preferably English, to a degree of oral and written fluency that fits in with the future needs of the graduates of each course.
   7. TEAMWORK. Being able to work as a team player, either as a member or as a leader. Contributing to projects pragmatically and responsibly, by reaching commitments in accordance to the resources that are available.
   8. EFFECTIVE USE OF INFORMATI0N RESOURCES. Managing the acquisition, structure, analysis and display of information from the own field of specialization. Taking a critical stance with regard to the results obtained.

34951 - NCA - Non-Commutative Algebra

Teaching methodology

Classes follow the traditional structure of lecture by the professor, together with the assignment of problems and exercises for the students to solve and present, either in written or in oral form.

Learning objectives of the subject

The main goal is to introduce the student into the basic ideas and techniques of non-commutative algebra, to the extend of being able to enroll into some initial research project in the area, if there is interest to do so.

Non-commutative algebra plays a significant role in the research panorama in mathematics today, but is underrepresented along the curriculum at the FME degree in mathematics. The main goal of the present topic is to fill this gap offering to the student a general but consistent introduction into the topic.

We'll center our attention towards the so-called "Geometric Group Theory", a relatively young and very active research area. This election is done because it allows to go, within a full semester, from the basics of the theory to the description, with a good level of details and context, of some open problems that are currently being object of active research today.

Study load

Total learning time: 187h 30m			
	Theory classes:	60h	32.00%
	Self study:	127h 30m	68.00%

34951 - NCA - Non-Commutative Algebra

Content

Generalities about infinite groups	Learning time: 47h
	Theory classes: 15h Self study : 32h

Description:
The free group: basic definitions.
Presentations: generators and relations.
Short exact sequences, direct and semidirect products.
Free products, amalgams, HNN extensions.
Thompson's group as an example.

The classical Dehn problems in group theory	Learning time: 25h
	Theory classes: 8h Self study : 17h

Description:
Description of the three classical algorithmic problems in group theory: word, conjugacy and isomorphism problems.
Resolution of the word and conjugacy problems in simple cases: abelian, free, free-like constructions, residually finite, etc.
Examples of algorithmically unsolvable problems: word, membership, isomorphism problems, $F\_2 \times F\_2$.

The free group	Learning time: 47h
	Theory classes: 15h Self study : 32h

Description:
Stallings foldings and the lattice of subgroups of the free group.
Membership, conjugacy, finite index, intersection of subgroups.
Hall's theorem and residual properties of free groups.

Cayley graphs	Learning time: 31h
	Theory classes: 10h Self study : 21h

Description:
Cayley graph and the word metric in a group.
Dehn function, examples; characterization of the solvability of the word problem via Dehn functions.
Growth of a group, examples. Gromov theorem.

34951 - NCA - Non-Commutative Algebra

Hyperbolic groups	Learning time: 37h 30m
	Theory classes: 12h Self study : 25h 30m

Description:
Definition of hyperbolic groups.
First properties, finite generation, centralizers.
Characterization of hyperbolic groups as those having linear Dehn function.

Qualification system

The student will have to develop a subject, first in term paper form, of about 15-20 pages, and also as a one to two hours lecture. The subject can be assigned by the teacher, or it can be picked by the student, among all topics in Geometric Group Theory of his interest.

Requirements

Basic abstract algebra, Topology and Differential Geometry
Commutative Algebra

Degree competences to which the subject contributes

Specific:
   1. RESEARCH. Read and understand advanced mathematical papers. Use mathematical research techniques to produce and transmit new results.
   2. CALCULUS. Obtain (exact or approximate) solutions for these models with the available resources, including computational means.
   3. CRITICAL ASSESSMENT. Discuss the validity, scope and relevance of these solutions; present results and defend conclusions.
Generical:
   4. SELF-DIRECTED LEARNING. Detecting gaps in one's knowledge and overcoming them through critical self-appraisal. Choosing the best path for broadening one's knowledge.
   5. EFFICIENT ORAL AND WRITTEN COMMUNICATION. Communicating verbally and in writing about learning outcomes, thought-building and decision-making. Taking part in debates about issues related to the own field of specialization.
   6. THIRD LANGUAGE. Learning a third language, preferably English, to a degree of oral and written fluency that fits in with the future needs of the graduates of each course.
   7. TEAMWORK. Being able to work as a team player, either as a member or as a leader. Contributing to projects pragmatically and responsibly, by reaching commitments in accordance to the resources that are available.
   8. EFFECTIVE USE OF INFORMATI0N RESOURCES. Managing the acquisition, structure, analysis and display of information from the own field of specialization. Taking a critical stance with regard to the results obtained.

Teaching methodology

There will be master classes where the different subjects are introduced and discussed with the students, and also some problem sessions.

Learning objectives of the subject

The main objective of the course is to introduce the student to the Algebraic Geometry of affine and projective varieties

34952 - AG - Algebraic Geometry

over a field. The course will be based on many examples, as in Harris book in the references, stressing the geometric interest of the subject, using the commutattive algebra only as a resource. At the end,depending on the audience, there will be some lectures on schemes theory and their role in algebraic geometry.

Study load

Total learning time: 187h 30m	Theory classes:	60h	32.00%
	Self study:	127h 30m	68.00%

34952 - AG - Algebraic Geometry

Content

Chapter 1: Algebraic sets	Learning time: 18h
	Theory classes: 4h Self study : 14h

Description:
Algebraic sets. Hilbert's basis and nullstellensatz theorems. Zariski topology.

Chapter 2: Algebraic varieties	Learning time: 28h
	Theory classes: 9h Self study : 19h

Description:
Affine algebraic varieties, ring of regular functions. Subvarieties. Products of varieties, fibered products. Separation axiom.

Chapter 3: Projective varieties	Learning time: 28h
	Theory classes: 9h Self study : 19h

Description:
Projective and quasi-projective varieties. Zariski topology on projective varieties. Regular functions. Examples: hypersurfaces, grassmanians. Completeness of projective varieties.

Chapter 4: Finite maps	Learning time: 28h
	Theory classes: 9h Self study : 19h

Description:
Basic properties. Noether normalization theorem. Zariski's main theorem. Proper maps. Normalization.

Chapter 5: Local theory	Learning time: 28h
	Theory classes: 9h Self study : 19h

Description:
Local ring. Tangent spaces. Nonsingular points. Nonsingularity and regularity. Smooth maps. Etale neighbourhoods.

34952 - AG - Algebraic Geometry

Chapter 6: Dimension theory	Learning time: 28h Theory classes: 9h Self study : 19h

Description:
 Dimension of affine varieties and of projective varieties. Dimension of the fibers of a morphism.

Chapter 7: Divisors, differentials and intersection theory	Learning time: 28h Theory classes: 9h Self study : 19h

Description:
 Divisors, intersectino theory of divisors. Bézout theorem. Differentials, the canonical divisor.

Qualification system

The qualification will be based on the exercises done as homework and the exposition of a subject developed by the student.

ECTS credits:	7,5 Teaching languages: English

Teaching staff

Coordinator:	JORDI GUARDIA RUBIES
Others:	
	JOSEP GONZALEZ ROVIRA - A
	JORDI GUARDIA RUBIES - A

Prior skills

Basic knowledge of algebraic structures: groups, rings and fields.

Requirements

Basic material covered in any standard course on group theory and Galois theory. Although it is not strictly necessary, any background on algebraic curves, elliptic curves and basic number theory. But the course will be completely self-contained.

Degree competences to which the subject contributes

Specific:
1. RESEARCH. Read and understand advanced mathematical papers. Use mathematical research techniques to produce and transmit new results.
2. CALCULUS. Obtain (exact or approximate) solutions for these models with the available resources, including computational means.
3. CRITICAL ASSESSMENT. Discuss the validity, scope and relevance of these solutions; present results and defend conclusions.

Generical:
4. SELF-DIRECTED LEARNING. Detecting gaps in one's knowledge and overcoming them through critical self-appraisal. Choosing the best path for broadening one's knowledge.
5. EFFICIENT ORAL AND WRITTEN COMMUNICATION. Communicating verbally and in writing about learning outcomes, thought-building and decision-making. Taking part in debates about issues related to the own field of specialization.
6. THIRD LANGUAGE. Learning a third language, preferably English, to a degree of oral and written fluency that fits in with the future needs of the graduates of each course.
7. TEAMWORK. Being able to work as a team player, either as a member or as a leader. Contributing to projects pragmatically and responsibly, by reaching commitments in accordance to the resources that are available.
8. EFFECTIVE USE OF INFORMATI0N RESOURCES. Managing the acquisition, structure, analysis and display of information from the own field of specialization. Taking a critical stance with regard to the results obtained.

34953 - NT - Number Theory

Teaching methodology

Most of the lectures will take place on the blackboard, explaining carefully the contents of the course and providing as much explicit examples, exercises and applications as possible. The students will be encouraged to consult suitable references and to discuss between them and with the professor in order to achieve a good understanding of the material.

Learning objectives of the subject

1) Algebraic number theory.
2) Arithmetic of elliptic curves

The material covered in this course interplays with topics of commutative algebra (Dedekind rings, discrete valuation rings and prime ideals), non-commutative algebra (group rings, quaternion añgebras, associative algebras) and algebraic geometry (spectrum of a ring, algebraic curves, Riemann surfaces).

Study load

Total learning time: 187h 30m	Theory classes:	60h	32.00%
	Self study:	127h 30m	68.00%

Content

Algebraic Number Theory	Learning time: 93h 45m
	Theory classes: 30h Self study : 63h 45m

Elliptic Curves	Learning time: 93h 45m
	Theory classes: 30h Self study : 63h 45m

Qualification system

There will be no exams. The qualification will be based on:
1) Active participation of the student during the course,
2) Resolution of exercises suggested in class and,
3) Ellaboration of a document in which the student develops in more detail and depth some of the material of the course.

Regulations for carrying out activities

Solved exercises and works must be delivered on the last day of the course.

8. EFFECTIVE USE OF INFORMATI0N RESOURCES. Managing the acquisition, structure, analysis and display of information from the own field of specialization. Taking a critical stance with regard to the results obtained.

34954 - CC - Codes and Cryptography

Teaching methodology

The course is divided in two parts: codes and cryptography. Each part consists of 26 h of ordinary classes and 13 of supervised works. In these works some specialized topics will be addressed in deep.

Learning objectives of the subject

This course aims to give a solid understanding of the uses of mathematics in Information technologies and modern communications. The course focuses on the reliable and efficient transmission and storage of the information. Both the mathematical foundations and the description of the most importants cryptographic protocols and coding systems are given in the course.

Study load

Total learning time: 187h 30m			
	Theory classes:	60h	32.00%
	Self study:	127h 30m	68.00%

34954 - CC - Codes and Cryptography

Content

Introduction to Coding theory	Learning time: 2h 24m
	Theory classes: 1h 36m Self study : 0h 48m

Description:
The problem of communication. Information heory, Coding theory and Cryptographic theory

Information and Entropy	Learning time: 8h 55m
	Theory classes: 3h 37m Self study : 5h 18m

Description:
Uncertainty or information. Entropy. Mutual information

Source codes without memory	Learning time: 10h 55m
	Theory classes: 3h 37m Self study : 7h 18m

Description:
Codes. Average length. Huffman codes. Extensions of a source. Theory of an noiseless communication. Notes of compression.

Channel coding	Learning time: 10h 55m
	Theory classes: 3h 37m Self study : 7h 18m

Description:
Discrete channels without memory. Symmetric channels. Shannon's theorem.

Finite fiels	Learning time: 8h 55m
	Theory classes: 2h 37m Self study : 6h 18m

Description:
Irreductible polynomials over Zp. Construction of finite fields. The multiplicative group of a finite field.

34954 - CC - Codes and Cryptography

Block codes	Learning time: 21h 55m
	Theory classes: 7h 37m Self study : 14h 18m

Description:
Hamming's distance. Detection and correction of errors. Bounds. Linear codes. Hamming codes. Reed-Muller codes. Hadamard codes

Cyclic codes	Learning time: 21h 55m
	Theory classes: 7h 37m Self study : 14h 18m

Description:
Cyclic codes. Generator and control matrices. Factorization of x^n-1. Roots of a cyclic code. BCH codes. Primitive Reed-Solomon codes. Meggit's decoder.

Introduction to cryptography	Learning time: 4h 55m
	Theory classes: 2h 37m Self study : 2h 18m

Description:
Symmetric key cryptography. Exemple AES.

Public key cryptography	Learning time: 14h 55m
	Theory classes: 4h 37m Self study : 10h 18m

Description:
Encryption. Digital signature. Examples: RSA and ElGamal. Public key infrastructure.

Standard hard problems	Learning time: 14h 55m
	Theory classes: 4h 37m Self study : 10h 18m

Description:
Factorization, discrete logarithm over finite fiels and elliptic curves. Codes and lattices. Pairings over elliptic curves.

34954 - CC - Codes and Cryptography

Analysis of the security of cryptographic protocols	Learning time: 18h 55m
	Theory classes: 6h 37m
	Self study : 12h 18m

Description:
  Security models. Proofs by reduction. Heuristic security, random oracle model.

Other cryptographic protocols of interest	Learning time: 14h 55m
	Theory classes: 4h 37m
	Self study : 10h 18m

Description:
  Identification protocols. Commitments. Zero-knowledge proofs.

Distributed cryptography	Learning time: 18h 55m
	Theory classes: 6h 37m
	Self study : 12h 18m

Description:
  Secret sharing schemes. Multiparty computation. Application to distributed encryption and digital signatures protocols.

Directed project	Learning time: 14h 06m
	Self study (distance learning): 14h 06m

Description:
  CODING: Weight enumeration polynomial, perfect codes, error bursts, Reed-Muller codes (alternative version) and Kerdock codes. Symmetric codes over F3.

  CRYPTOGRAPHY: Electronic voting, electronic commerce, management of private data, quantum cryptography.

Qualification system

Classroom problems: 2 points out of 10
Theory exam: 2.5 points out of 10
Supervised work (including oral presentation): 2 points out of 10
Final exam: 3.5 points out of 10

34954 - CC - Codes and Cryptography

Regulations for carrying out activities

All the subjects are important. To pass the course it is required to fulfill all the items.

Prior skills

Basic calculus and linear algebra. Notions of probability.

Degree competences to which the subject contributes

Specific:
1. RESEARCH. Read and understand advanced mathematical papers. Use mathematical research techniques to produce and transmit new results.
2. CALCULUS. Obtain (exact or approximate) solutions for these models with the available resources, including computational means.
3. CRITICAL ASSESSMENT. Discuss the validity, scope and relevance of these solutions; present results and defend conclusions.

Generical:
4. SELF-DIRECTED LEARNING. Detecting gaps in one's knowledge and overcoming them through critical self-appraisal. Choosing the best path for broadening one's knowledge.
5. EFFICIENT ORAL AND WRITTEN COMMUNICATION. Communicating verbally and in writing about learning outcomes, thought-building and decision-making. Taking part in debates about issues related to the own field of specialization.
6. THIRD LANGUAGE. Learning a third language, preferably English, to a degree of oral and written fluency that fits in with the future needs of the graduates of each course.
7. TEAMWORK. Being able to work as a team player, either as a member or as a leader. Contributing to projects pragmatically and responsibly, by reaching commitments in accordance to the resources that are available.
8. EFFECTIVE USE OF INFORMATION RESOURCES. Managing the acquisition, structure, analysis and display of information from the own field of specialization. Taking a critical stance with regard to the results obtained.

Teaching methodology

There will be a lecture each week, followed by a problem session.

Learning objectives of the subject

To use algebraic, probabilistic and analytic methods for studying combinatorial structures. The main topics of study are:

34955 - COMB - Combinatorics

partially ordered sets, extremal set theory,finite geometries, matroids, Ramsey theory and enumerative combinatorics.

Study load

Total learning time: 187h 30m	Theory classes:	60h	32.00%
	Self study:	127h 30m	68.00%

34955 - COMB - Combinatorics

Content

Partially ordered sets	Learning time: 24h 40m
	Theory classes: 4h Practical classes: 4h Self study : 16h 40m

Description:
 Sperner's theorem. LYM inequalities. Bollobás's theorem. Dilworth's theorem

Extremal set theory	Learning time: 24h 40m
	Theory classes: 4h Practical classes: 4h Self study : 16h 40m

Description:
 Theorems of Baranyai, Erdos-de Bruijn and Erdos-Ko-Rado

Linear algebra methods in combinatorics	Learning time: 18h 30m
	Theory classes: 3h Practical classes: 3h Self study : 12h 30m

Description:
 The polynomial method and applications. Fisher's theorem. Equiangular lines, sets with few differences

Finite geometries	Learning time: 18h 30m
	Theory classes: 3h Practical classes: 3h Self study : 12h 30m

Description:
 q-anologs of extremal problems. Segre's theorem. Blocking sets, ovals and hyperovals.

34955 - COMB - Combinatorics

Matroids	Learning time: 18h 30m
	Theory classes: 3h Practical classes: 3h Self study : 12h 30m

Description:
 Axioms. Transversal matroids. Greedy algorithms. The Tutte polynomial

Probabilistic methods in combinatorics	Learning time: 18h 30m
	Theory classes: 3h Practical classes: 3h Self study : 12h 30m

Description:
 Permanents, transversals, hypergraph coloring. Monotone properties and threshold functions

Ramsey theory	Learning time: 31h 40m
	Theory classes: 5h Practical classes: 5h Self study : 21h 40m

Description:
 Theorems of Ramsey and Hales-Jewett. Theorems of Schur, Van der Waerden and Rado.

Enumerative combinatorics	Learning time: 32h 30m
	Theory classes: 5h Practical classes: 5h Self study : 22h 30m

Description:
 Symbolic and analytic methods. Symmetries and Pólya theory.

Qualification system

Grading will be based on the solution of exercises. Eventually there will a final examination.

Coordinating unit:	200 - FME - School of Mathematics and Statistics
Teaching unit:	726 - MA II - Department of Applied Mathematics II
Academic year:	2013
Degree:	MASTER IN ADVANCED MATHEMATICS AND MATHEMATICAL ENGINEERING (Syllabus 2010). (Teaching unit Optative)
ECTS credits:	7,5 Teaching languages: English

Teaching staff

Coordinator:	JULIAN THORALF PFEIFLE
Others:	
	FERNANDO ALFREDO HURTADO DIAZ - A
	JULIAN THORALF PFEIFLE - A

Prior skills

- Elementary combinatorics.
- Elementary graph theory.
- Elementary algorithmics.
- Elementary data structures.

Degree competences to which the subject contributes

Specific:
1. RESEARCH. Read and understand advanced mathematical papers. Use mathematical research techniques to produce and transmit new results.
2. CALCULUS. Obtain (exact or approximate) solutions for these models with the available resources, including computational means.
3. CRITICAL ASSESSMENT. Discuss the validity, scope and relevance of these solutions; present results and defend conclusions.

Generical:
4. SELF-DIRECTED LEARNING. Detecting gaps in one's knowledge and overcoming them through critical self-appraisal. Choosing the best path for broadening one's knowledge.
5. EFFICIENT ORAL AND WRITTEN COMMUNICATION. Communicating verbally and in writing about learning outcomes, thought-building and decision-making. Taking part in debates about issues related to the own field of specialization.
6. THIRD LANGUAGE. Learning a third language, preferably English, to a degree of oral and written fluency that fits in with the future needs of the graduates of each course.
7. TEAMWORK. Being able to work as a team player, either as a member or as a leader. Contributing to projects pragmatically and responsibly, by reaching commitments in accordance to the resources that are available.
8. EFFECTIVE USE OF INFORMATI0N RESOURCES. Managing the acquisition, structure, analysis and display of information from the own field of specialization. Taking a critical stance with regard to the results obtained.

34956 - DG - Discrete and Algorithmic Geometry

Teaching methodology

Theory classes will be used to present and develop the contents of the course. Most of the topics will be presented by the instructors, but there can be some sessions devoted to students presentations.

There will be lists of problems, which will not contain solutions. Problems will be designed to help students deepen and mature their command of the concepts and techniques presented in class. Some problems will be solved in class, some will be left as homework. In the problem sessions, the goal will be to propose and analyze alternative strategies to solve each problem, and to show how the results presented in class are applied. Most of the problems solved in class will be presented by the students.

Learning objectives of the subject

Discrete, combinatorial and computational geometry are facets of a common body of knowledge that integrates fundamental elements from mathematics -mainly from algebra, topology and classical branches of geometry- with elements and problems from theoretical computer science and its applications.

The area focuses on the combinatorial and structural study of discrete geometric objects, as well as the design of algorithms to construct or analyze them. Among the objects studied, we can mention discrete sets of points, curves and manifolds, polytopes, convex bodies, packings, space decompositions, graphs, and geometric matroids.

By the end of the course, students should:
- Be able to recognize and formally express discrete geometric problems.
- Be able to discretize geometric problems, when possible.
- Be able to apply combinatorial techniques, as well as data structures and algorithms to discrete geometric problems.
- Be able to search the bibliography, and to understand the scientific literature on the subject.
- Be aware of the wide range of fields and problems to which discrete geometry results apply.
- Be aware of the most commonly used software in the field.

Study load

Total learning time: 187h 30m			
	Theory classes:	60h	32.00%
	Self study:	127h 30m	68.00%

34956 - DG - Discrete and Algorithmic Geometry

Content

Preliminaries	Learning time: 12h 30m
	Theory classes: 4h Self study : 8h 30m

Description:
Computational complexity. Data structures. Representation of geometric objects.

Convexity	Learning time: 19h
	Theory classes: 4h Practical classes: 2h Self study : 13h

Description:
Convex hull computation. Linear programming in low dimensions.

Decompositions and arrangements	Learning time: 31h
	Theory classes: 7h Practical classes: 3h Self study : 21h

Description:
Subdivisions and triangulations of point sets and polygons. Visibility and motion planning. Duality. Special decompositions in dimension 2. The zone theorem. Incremental construction and randomized algorithms. Complexity. Levels and k-sets.

Proximity Structures	Learning time: 31h
	Theory classes: 7h Practical classes: 3h Self study : 21h

Description:
Proximity problems. Voronoi diagram, Delaunay triangulation. Shape reconstruction.

34956 - DG - Discrete and Algorithmic Geometry

Polytopes and Subdivisions of Point Sets	Learning time: 38h
	Theory classes: 10h Practical classes: 3h Self study : 25h

Description:
Homogeneous coordinates. Polytopes: faces and boundary structure; examples; operations on polytopes (polarity, products, etc.). Point sets: subdivisions and triangulations (including Delaunay and Voronoi).

Lattice Geometry	Learning time: 24h
	Theory classes: 6h Practical classes: 2h Self study : 16h

Description:
Examples of lattices. Ehrhart's Theorem on integer points in polytopes. Brion's Theorem.

Symmetry	Learning time: 23h
	Theory classes: 6h Practical classes: 1h Self study : 16h

Description:
Orbifolds and the Magic Theorem on symmetry groups in the plane. Exploitation of symmetry in linear optimization.

Software	Learning time: 9h
	Laboratory classes: 2h Self study : 7h

Description:
Polymake, Curved Spaces, etc.

34956 - DG - Discrete and Algorithmic Geometry

Qualification system

In general, there will be two or more exams during class hours, to be announced in advance. If so announced, students will also obtain marks by turning in their solutions to problems from the problem sets, and possibly presenting them at the blackboard.

In the case of a very small group, some exams may be replaced by personal work.

The exams and marks for the turned-in work will combine for the final qualification.

34957 - GT - Graph Theory

Content

Spectral techniques in Graph Theory

Degree competences to which the content contributes:

Description:
Adjacency and Laplacian matrix. Spectral properties. Cospectral graphs. Graph invariants and spectral properties: chromatic number, Cheeger constant, expansion properties, maxcut, bisection width. The matrix tree theorem. Random walks in graphs. Shannon capacity.

Specific objectives:

Symmetries in graphs

Degree competences to which the content contributes:

Minors and treewidth

Degree competences to which the content contributes:

Graphs on surfaces

Degree competences to which the content contributes:

Graph homomorphisms

Degree competences to which the content contributes:

Random graphs

Degree competences to which the content contributes:

Extremal Graph Theory

Learning time: 75h

Theory classes: 24h 10m
Practical classes: 24h 10m
Assessment sessions: 3h
Self study (distance learning): 23h 40m

34957 - GT - Graph Theory

Qualification system

The evaluation of the course is based on the weekly work on problems proposed in the presentation sessions. There will be a final comprehensive exam based on the problem sessions during the course.

Regulations for carrying out activities

The active participation in the course is a requirement for the evaluation of the final exam.

ECTS credits:	7,5 Teaching languages: English

Teaching staff

Coordinator: JOAN DE SOLÀ-MORALES RUBIÓ

Prior skills

* Good knowledge of Calculus techniques, including integral theorems and basic Complex Variable methods.
* Elementary solution of PDEs and ODEs.
* Some experience on simple cases of mathematical modelling, especially in classical physics (gravitation, heat conduction, mechanics or electromagnetism).

Degree competences to which the subject contributes

Specific:
　1. RESEARCH. Read and understand advanced mathematical papers. Use mathematical research techniques to produce and transmit new results.
　2. MODELLING. Formulate, analyse and validate mathematical models of practical problems by using the appropriate mathematical tools.
　3. CALCULUS. Obtain (exact or approximate) solutions for these models with the available resources, including computational means.
　4. CRITICAL ASSESSMENT. Discuss the validity, scope and relevance of these solutions; present results and defend conclusions.
Generical:
　5. SELF-DIRECTED LEARNING. Detecting gaps in one's knowledge and overcoming them through critical self-appraisal. Choosing the best path for broadening one's knowledge.
　6. EFFICIENT ORAL AND WRITTEN COMMUNICATION. Communicating verbally and in writing about learning outcomes, thought-building and decision-making. Taking part in debates about issues related to the own field of specialization.
　7. THIRD LANGUAGE. Learning a third language, preferably English, to a degree of oral and written fluency that fits in with the future needs of the graduates of each course.
　8. TEAMWORK. Being able to work as a team player, either as a member or as a leader. Contributing to projects pragmatically and responsibly, by reaching commitments in accordance to the resources that are available.
　9. EFFECTIVE USE OF INFORMATI0N RESOURCES. Managing the acquisition, structure, analysis and display of information from the own field of specialization. Taking a critical stance with regard to the results obtained.

Teaching methodology

Lectures will contain the main contents of the course, but the students will also be asked to make presentations of additional material in seminar sessions. Problem solution will also be asked.

34958 - MMPDE - Mathematical Modelling with Partial Differential Equations

Learning objectives of the subject

The course will provide a general overview on the use of partial differential equations (PDE) and boundary value problems to construct mathematical models of real phenomena.
By the end of the course the student should have acquired:

* a knowledge of the problems that can be modelled with PDE's.
* intuitive and physical interpretations of the terms that appear on PDE's.

    9. EFFECTIVE USE OF INFORMATION RESOURCES. Managing the acquisition, structure, analysis and display of information from the own field of specialization. Taking a critical stance with regard to the results obtained.

Teaching methodology

Three elements will be combined: theory classes, where the main concepts will be presented; practical classes in the computer room, with emphasis on the computational aspects; lists of problems. Students will work on these problems individually or in pairs.

Learning objectives of the subject

The main objective is to provide a general perspective of the broad field of computational mechanics, covering both the

34959 - CM - Computational Mechanics

modelling and the computational aspects. A broad range of problems is addressed: solids, fluids and fluid-solid interaction; linear and nonlinear models; static and dynamic problems. By the end of the course, the students should:
- Be able to choose the appropriate type of model for a specific simulation
- Be familiar with the mathematical objects (mainly tensors) used in computational mechanics
- Be aware of the different level of complexity of various problems (e.g. linear vs. nonlinear, static vs. dynamic).

34959 - CM - Computational Mechanics

Content

CONTINUUM MECHANICS	Learning time: 31h 15m
	Theory classes: 8h Practical classes: 2h Self study : 21h 15m

Description:
Motivation. Definition of continuous media. Equation of motion: Eulerian and Lagrangian descriptions. Time derivatives. Strains: deformation gradient, Green and Euler-Almansi tensors; elongation and shear; small strains. Stresses: body and surface forces; Cauchy stress tensor. Balance equations: Reynolds transport theorem; mass balance; momentum balance. Constitutive equations. Applications.

COMPUTATIONAL ELASTICITY	Learning time: 31h 15m
	Theory classes: 8h Practical classes: 2h Self study : 21h 15m

Description:
Basic concepts and motivation. Elastic constitutive equation. Displacement formulation: Navier equations. Two-dimensional elasticity: plane stresses, plane strains and axisymmetry. Weak form of the elastic problem. Computational aspects. Applications.

COMPUTATIONAL FLUID DYNAMICS	Learning time: 31h 15m
	Theory classes: 8h Practical classes: 2h Self study : 21h 15m

Description:
Basic concepts and motivation. Rate-of-deformation and spin tensors. Constitutive equation for Newtonian fluids. Euler equations for inviscid flow. Navier-Stokes equations for viscous flow in strong form and in weak form. Reynolds number. Stokes flow and potential flow. Applications.

34959 - CM - Computational Mechanics

COMPUTATIONAL PLASTICITY	Learning time: 31h 15m
	Theory classes: 8h Practical classes: 2h Self study : 21h 15m

Description:
Basic concepts and motivation. One-dimensional plasticity: elastic and plastic strains;
elastoplastic constitutive equation; hardening. Multi-dimensional plasticity: stress and strain invariants; yield
surface; plastic flow. Numerical time-integration of the constitutive equation: elastic prediction and plastic
correction; iterative methods for the plastic correction. Applications.

COMPUTATIONAL DYNAMICS	Learning time: 31h 15m
	Theory classes: 8h Practical classes: 2h Self study : 21h 15m

COMPUTATIONAL METHODS FOR WAVE PROBLEMS	Learning time: 31h 15m
	Theory classes: 8h Practical classes: 2h Self study : 21h 15m

Description:
Basic concepts and motivation.
Acoustics: the wave equation. The scalar Helmholtz equation. Vibroacoustics: acoustic
fluid-elastic solid interaction. Computational aspects. Applications.
Electromagnetism: the Maxwell equations. Electrodynamics. The vectorial Helmholtz equation. Computational
aspects. Applications.

Qualification system

Exam and assigned problems.

6. EFFICIENT ORAL AND WRITTEN COMMUNICATION. Communicating verbally and in writing about learning outcomes, thought-building and decision-making. Taking part in debates about issues related to the own field of specialization.
7. THIRD LANGUAGE. Learning a third language, preferably English, to a degree of oral and written fluency that fits in

34960 - MMB - Mathematical Models in Biology

with the future needs of the graduates of each course.

8. TEAMWORK. Being able to work as a team player, either as a member or as a leader. Contributing to projects pragmatically and responsibly, by reaching commitments in accordance to the resources that are available.
9. EFFECTIVE USE OF INFORMATION RESOURCES. Managing the acquisition, structure, analysis and display of information from the own field of specialization. Taking a critical stance with regard to the results obtained.

Teaching methodology

The course will consist of lectures, problem sessions and practical computer sessions. Lectures will consist of expositions about the contents of this subject following a biological problem.

Both practical sessions and problem sessions will be in a PC room and will help the student to develop part of the subject with extensions to the lectures, practical problems with real or simulated data and algorithms to perform these operations. The SAGE computing environment will be used, with interfaces to Python, R and C if necessary.

Learning objectives of the subject

This course is an introduction to the most common mathematical models in biology: in populations dynamics, ecology, physiology, sequence analysis and phylogenetics. At the end of the course the student should be able to:

* Understand and discuss basic models of dynamical systems of biological origin, in terms of the parameters.
* Model simple phenomena, analyze them (numerically and/or analytically) and understand the effect of parameters.
* Understand the diversity of mechanisms and the different levels of modelization of physiological activity.
* Obtain and analyze genomic sequences of real biological species and databases containing them.
* Use computer software for gene prediction, alignment and phylogenetic reconstruction.
* Understand different gene prediction, alignment and phylogenetic reconstruction methods.
* Compare the predictions given by the models with real data.
* Communicate results in interdisciplinary teams.

| | Self study: | 127h 30m | 68.00% |

34960 - MMB - Mathematical Models in Biology

Content

Models of Population Dynamics	Learning time: 56h 20m
	Theory classes: 9h Practical classes: 9h Self study : 38h 20m

Description:
1. Differential equations models. Stability and Bifurcations. Applications to population dynamics.
2. One-dimensional discrete models. Chaos in biological systems.
3. Introduction to stochastic models. Branching processes
4. Simulation with SAGE

Mathematical models in Genomics	Learning time: 62h 30m
	Theory classes: 12h Practical classes: 8h Self study : 42h 30m

Description:
1. Brief introduction to genomics (genome, gen structure, genetic code...). Genome databases online.
2. Phylogenetics: Markov models of molecular evolution (Jukes-Cantor, Kimura, Felsenstein hierarchy...), phylogenetic trees, branch lengths. Phylogenetic tree reconstruction (distance and character based methods).
3. Genomics: Markov chains and Hidden Markov models for gene prediction. Tropical arithmetics and Viterbi algorithm. Forward and Expectation-Maximization algorithms.
4. Multiple sequence alignment: dynamical programming, tropical arithmetics and Pair-HMMs

Mathematical Models in Neurohysiology	Learning time: 56h 20m
	Theory classes: 11h Practical classes: 7h Self study : 38h 20m

Biological networks	Learning time: 12h 20m
	Theory classes: 3h Practical classes: 1h Self study : 8h 20m

Description:
1. Complex networks in biology.
2. Networks of neurons.

34960 - MMB - Mathematical Models in Biology

Qualification system

The course has three parts and each of these parts will give a part of the qualification, based on practical problems to be delivered. Besides, students will be asked to write a report on a specialized subject (from a list of suggested topics) and deliver it 2 days before presenting it in front of the students and teachers . The contents and the clarity of explanations and exposition.

The final qualification will be given by the formula $0.6*NP+0.4*NT$ where:

- $NP=NP1+NP2+NP3$ practice qualification: this is the qualification of 3 practical qualifications and the participation at class.

- NT=report qualification.

Opening hours

Timetable: A convenir

Prior skills

Basic knowledge of calculus, algebra and differential equations. Some basic ideas of local dynamical systems.

Degree competences to which the subject contributes

Specific:
1. RESEARCH. Read and understand advanced mathematical papers. Use mathematical research techniques to produce and transmit new results.
2. MODELLING. Formulate, analyse and validate mathematical models of practical problems by using the appropriate mathematical tools.
3. CALCULUS. Obtain (exact or approximate) solutions for these models with the available resources, including computational means.
4. CRITICAL ASSESSMENT. Discuss the validity, scope and relevance of these solutions; present results and defend conclusions.
Generical:
5. SELF-DIRECTED LEARNING. Detecting gaps in one's knowledge and overcoming them through critical self-appraisal. Choosing the best path for broadening one's knowledge.
6. EFFICIENT ORAL AND WRITTEN COMMUNICATION. Communicating verbally and in writing about learning outcomes, thought-building and decision-making. Taking part in debates about issues related to the own field of specialization.
7. THIRD LANGUAGE. Learning a third language, preferably English, to a degree of oral and written fluency that fits in with the future needs of the graduates of each course.
8. TEAMWORK. Being able to work as a team player, either as a member or as a leader. Contributing to projects pragmatically and responsibly, by reaching commitments in accordance to the resources that are available.
9. EFFECTIVE USE OF INFORMATI0N RESOURCES. Managing the acquisition, structure, analysis and display of information from the own field of specialization. Taking a critical stance with regard to the results obtained.

34961 - QQMDS - Quantitative and Qualitative Methods in Dynamical Systems

Teaching methodology

We don't distinguish theoretical and practical classes. Some results about modern theory in Dynamical systems are presented in class. The main idea is to give basic knowledge and useful tools in the study of a dynamical system from both quantitative and qualitative points of view. We will stress the relation between different kind of systems and we will mainly focus in the use of perturvatives techniques to study a dynamical system globally.

Learning objectives of the subject

Study load

Total learning time: 187h 30m			
	Theory classes:	60h	32.00%
	Self study:	127h 30m	68.00%

34961 - QQMDS - Quantitative and Qualitative Methods in Dynamical Systems

Content

-Invariant objects in Dynamical Systems	Learning time: 20h
	Theory classes: 5h Practical classes: 5h Other activities: 10h

Description:
Continuous and dicrete Dynamical Systems. Poincaré map. Local behaviour of hyperbolic invariant objects. Invariant manifolds. Central manifold. Local bifurcations.

-Perturbation theory in Dynamical Systems	Learning time: 20h
	Theory classes: 5h Practical classes: 5h Other activities: 10h

Description:
Clasic perturbation theory. Perturbed homoclinic orbits in the plane. Melnikov method.

Discrete Dynamical Systems	Learning time: 20h
	Theory classes: 5h Practical classes: 5h Other activities: 10h

Description:
Discrete systems. Denjoy theorem. Generic properties. Sarkovskii theorem.

-Homoclinic points and chaotic Dynamics	Learning time: 20h
	Theory classes: 5h Practical classes: 5h Other activities: 10h

Description:
Homoclinic points and bifurcations. Hyperbolic sets and transversal homoclinic points. Dynamical systems with chaotic dynamics. Newhouse phenomenum.

34961 - QQMDS - Quantitative and Qualitative Methods in Dynamical Systems

-Normal forms	Learning time: 20h Theory classes: 5h Practical classes: 5h Other activities: 10h

Description:
Poincaré-Dulac normal forms. Convergence: Poincaré and Siegel domains.
Hamiltoniane normal forms. Bifurcations. Lie series. Construction of
algebraic and analytic manipulators.

-Normal forms: its aplication to stability in Dynamical Systems	Learning time: 20h Theory classes: 5h Practical classes: 5h Other activities: 10h

Description:
 KAM (Kolmogorov-Arnold-Moser) theory, twist theorem. Small divisors and diophantic inequalities. Efective
stability and Nekhoroshev theorem.
Splitting of separatrices, Melnikov potential. Arnold diffusion.

Qualification system

The students have to do some problems and a research work. On the other hand they will attend the "Jornades
d'iniciació als Sistemes dinàmics i les EDP"
and produce a document about them.

Regulations for carrying out activities

There are no exams.

34962 - HS - Hamiltonian Systems

Learning objectives of the subject

To comprehend the basic foundations of the theory of Hamiltonian systems, and to understand its applications to the Celestial Mechanics and other fields.

Study load

Total learning time: 187h 30m			
	Theory classes:	60h	32.00%
	Self study:	127h 30m	68.00%

34962 - HS - Hamiltonian Systems

Content

Hamiltonian formalism	Learning time: 26h
	Theory classes: 4h
	Practical classes: 4h
	Self study : 18h

Description:
Hamiltonian dynamical systems: symplectic maps, symplectic manifolds. Linear Hamiltonian systems and their application to the study of stability of equilibrium points.

Hamiltonian and Lagrangian systems	Learning time: 13h
	Theory classes: 2h
	Practical classes: 2h
	Self study : 9h

Description:
Lagrangian systems. Configuration manifold, tangent and cotangent bundles. Systems with symmetries, Noether theorem. Principle of minimal action.

Integrable and quasi-integrable Hamiltonian systems	Learning time: 13h
	Theory classes: 2h
	Practical classes: 2h
	Self study : 9h

Description:
Complete integrability and Liouville-Arnold theorem. Quasi-periodic flows on a torus, resonances. Examples of quasi-integrable systems. Twist maps and billiards. Analytic non-integrability.

Invariant objects of dynamical systems	Learning time: 13h
	Theory classes: 2h
	Practical classes: 2h
	Self study : 9h

Description:
Continuous and discrete dynamical systems, Poincaré map. Local structure of hyperbolic invariant objects: invariant manifolds. Center manifold. Local bifurcations.

34962 - HS - Hamiltonian Systems

Perturbation theory in dynamical systems	Learning time: 13h
	Theory classes: 2h Practical classes: 2h Self study : 9h

Description:
Classical perturbation theory. Perturbations of homoclinic orbits in the plane: Melnikov method.

Homoclinic points and chaotic dynamics	Learning time: 13h
	Theory classes: 2h Practical classes: 2h Self study : 9h

Description:
Homoclinic points and bifurcations. Hyperbolic sets and transverse homoclinic
points: systems with chaotic dynamics. Newhouse phenomenon.

Normal forms	Learning time: 13h
	Theory classes: 2h Practical classes: 2h Self study : 9h

Description:
Poincaré-Dulac normal forms. Convergence: Poincaré and Siegel domains.
Hamiltonian normal forms. Bifurcstions. Lie series. Construction of algebraic
manipulators.

Stability of dynamical systems and Hamiltonian systems	Learning time: 13h
	Theory classes: 2h Practical classes: 2h Self study : 9h

Description:
KAM theory (Kolmogorov-Arnold-Moser), twist theorem. Small divisors and
Diophantine inequalities. Effective stability and Nekhoroshev theorem.
Splitting of separatrices, Melnikov potential. Arnold diffusion.

34962 - HS - Hamiltonian Systems

Discrete dynamical systems	Learning time: 13h
	Theory classes: 2h Practical classes: 2h Self study : 9h

Description:
 Discrete systems. Denjoy theorem. Generic properties. Sarkovskii theorem.

Recent Trends in Nonlinear Science	Learning time: 57h 30m
	Theory classes: 20h Self study : 37h 30m

Description:
 Smooth Ergodic Theory: Lyapunov exponents, Oseledets' Theorem, nonuniform hyperbolicity.

 Delay equations with applications to engineering: delay equations, stability, bifurcations.

 Multi-frequency Oscillations in Dynamical Systems.

Planning of activities

RECENT TRENDS IN NONLINEAR SCIENCE

Description:
 Attendance to the winter school RTNS http://www.dance-net.org/index.php?contingut=rtns.php

Specific objectives:
 To learn from oustanding researchers a view of the state of the art in several research topics, interacting with students of the rest of Spain and of the World.

Qualification system

The students have to do some problems and a research work. Moreover, they will attend the RTNS and produce a document about them.

    6. EFFICIENT ORAL AND WRITTEN COMMUNICATION. Communicating verbally and in writing about learning outcomes, thought-building and decision-making. Taking part in debates about issues related to the own field of specialization.
    7. THIRD LANGUAGE. Learning a third language, preferably English, to a degree of oral and written fluency that fits in with the future needs of the graduates of each course.
    8. TEAMWORK. Being able to work as a team player, either as a member or as a leader. Contributing to projects pragmatically and responsibly, by reaching commitments in accordance to the resources that are available.
    9. EFFECTIVE USE OF INFORMATION RESOURCES. Managing the acquisition, structure, analysis and display of information from the own field of specialization. Taking a critical stance with regard to the results obtained.

34963 - ACPDE - Advanced Course in Partial Differential Equations

Teaching methodology

Classes will combine theoretical aspects and proofs with resolution of concrete problems and exercises. Further reading from the bibliography will be given often.

Learning objectives of the subject

Understand the classical methods to solve the Laplace, heat, and wave equations.
Understand the role of Sobolev norms and compact embeddings to solve PDEs and find spectral decompositions.
Learn the main methods available to solve nonlinear PDEs, through simple cases.

Study load

Total learning time: 187h 30m			
	Theory classes:	60h	32.00%
	Self study:	127h 30m	68.00%

34963 - ACPDE - Advanced Course in Partial Differential Equations

Content

Classical methods for the Poisson and heat equations	Learning time: 47h
	Theory classes: 15h
	Self study : 32h

Description:
Maximum principles and Green's functions for the Poisson and heat equations.

Sobolev spaces and variational methods	Learning time: 47h
	Theory classes: 15h
	Self study : 32h

Description:
Basic properties of Sobolev spaces. Weak or variational formulation of boundary problems for linear elliptic PDEs.

Evolution equations	Learning time: 46h 45m
	Theory classes: 15h
	Self study : 31h 45m

Description:
Prabolic equations. Galerkin method. Semigroups. Nonlinear conservation laws.

Introduction to nonlinear PDEs	Learning time: 46h 45m
	Theory classes: 15h
	Self study : 31h 45m

Description:
Calculus of Variations. Nonlinear eigenvalue problems. Semi-linear elliptic equations.

Qualification system

The evaluation of the course is based:
- on the weekly resolution of problems proposed in class;
- on a presentation (written and in class) of a further developed
topic on the subject;
- eventually there will be a final comprehensive exam.

The active participation during the course will be a requirement for the evaluation of the final exam.

Teaching methodology

Lectures, practical work at computer room, exercises and home works.

Learning objectives of the subject

34965 - NMPDE - Numerical Methods for Partial Differential Equations

This course is an introduction to numerical methods for the approximation of partial differential equations.
The indicative content of the course is as follows:

- Introduction to partial differential equations and to the finite elements method.
- Mathematical background: distributions, Sobolev spaces and weak formulations.
- Finite elements for elliptic problems: weak formulation with different types of boundary conditions; well-posedness of the variation formulation (the Lax-Milgram lemma); set up, analysis and error estimates for the finite elements Galerkin approximation.
- Finite element approximation of the Navier-Stokes equations for incompressible flows.
- Introduction to domain decomposition methods.

The course will include frontal lectures and exercises, as well as computer sessions aimed at introducing the bases of the programming of finite element methods.

34965 - NMPDE - Numerical Methods for Partial Differential Equations

Content

Introduction to partial differential equations and basics of functional analysis	Learning time: 12h Theory classes: 4h Practical classes: 2h Self study : 6h

Elliptic partial differential equations	Learning time: 32h Theory classes: 4h Practical classes: 4h Self study : 24h

The finite element method	Learning time: 32h Theory classes: 4h Practical classes: 4h Self study : 24h

Approximation of elliptic PDEs by the Galerkin finite elements method	Learning time: 33h 30m Theory classes: 4h Practical classes: 4h Self study : 25h 30m

Numerical approximation of the Navier-Stokes equations	Learning time: 44h Theory classes: 10h Practical classes: 10h Self study : 24h

Introduction to domain decomposition methods	Learning time: 34h Theory classes: 6h Practical classes: 4h Self study : 24h

34965 - NMPDE - Numerical Methods for Partial Differential Equations

Qualification system

Continuous assessment: during the course students will be required to carry out two projects. The projects must be done individually and they constitute the 50% of the final mark.

Final exam: at the end of the course a written exam will take place. The exam will focus on all the topics studied during the course and it constitutes the 50% of the final mark.

34966 - VD - Differentiable Manifolds

Coordinating unit:	200 - FME - School of Mathematics and Statistics
Teaching unit:	743 - MA IV - Department of Applied Mathematics IV
Academic year:	2013
Degree:	MASTER IN ADVANCED MATHEMATICS AND MATHEMATICAL ENGINEERING (Syllabus 2010). (Teaching unit Optative)
ECTS credits:	7,5 Teaching languages: English

Teaching staff

Coordinator: FRANCESC XAVIER GRACIA SABATE

Prior skills

Basic courses on algebra, calculus, topology and differential equations, and calculus on manifolds.

Degree competences to which the subject contributes

Specific:
   1. RESEARCH. Read and understand advanced mathematical papers. Use mathematical research techniques to produce and transmit new results.
   3. CALCULUS. Obtain (exact or approximate) solutions for these models with the available resources, including computational means.
   4. CRITICAL ASSESSMENT. Discuss the validity, scope and relevance of these solutions; present results and defend conclusions.
Generical:
   5. SELF-DIRECTED LEARNING. Detecting gaps in one's knowledge and overcoming them through critical self-appraisal. Choosing the best path for broadening one's knowledge.
   6. EFFICIENT ORAL AND WRITTEN COMMUNICATION. Communicating verbally and in writing about learning outcomes, thought-building and decision-making. Taking part in debates about issues related to the own field of specialization.
   7. THIRD LANGUAGE. Learning a third language, preferably English, to a degree of oral and written fluency that fits in with the future needs of the graduates of each course.
   8. TEAMWORK. Being able to work as a team player, either as a member or as a leader. Contributing to projects pragmatically and responsibly, by reaching commitments in accordance to the resources that are available.
   9. EFFECTIVE USE OF INFORMATI0N RESOURCES. Managing the acquisition, structure, analysis and display of information from the own field of specialization. Taking a critical stance with regard to the results obtained.

Teaching methodology

Theory classes will be used to present and develop the contents of the course. Most of the topics will be presented by the instructors, but there can be some sessions presented by students. Along the course the students will be given problems to solve as homework.

Learning objectives of the subject

The subject focuses on the fundamental topics used in differential geometry and applications in different areas.
By the end of the course, students should:
- Be able to understand all the ideas developed along the course.
- Be able to apply the studied concepts to other areas such as theoretical mechanics, control theory, mathematical

34966 - VD - Differentiable Manifolds

physics or geometric dynamical systems.
- Be able to enter a research group on these kinds of topics and their applications.
- Be able to search the bibliography, and to understand the scientific literature on the subject.
- Be able to write and present an essay on mathematics.

Study load

Total learning time: 187h 30m	Theory classes:	60h	32.00%
	Self study:	127h 30m	68.00%

Content

Basic differential geometry	Learning time: 47h
	Theory classes: 15h Self study : 32h

Riemannian manifolds and symplectic manifolds
Degree competences to which the content contributes:

Lie groups and Lie algebras	Learning time: 62h 30m
	Theory classes: 20h Self study : 42h 30m

Supplements on topology and analysis	Learning time: 47h
	Theory classes: 15h Self study : 32h

Applications	Learning time: 31h
	Theory classes: 10h Self study : 21h

34966 - VD - Differentiable Manifolds

Qualification system

Evaluation is based on students' participation and homework, and on the completion and presentation of an essay (a written work) on a topic on differential geometry.
Eventually, there will be a final examination.
